- HydroStraw® vs. Blown Straw

MAKES GRASS GROW

EASIER & FASTER APPLICATION

Easy to pour bales and application through a hydro seeder allow you to do more work in less time. The HydroStraw® product requires less water to apply making you more efficient. You can now add 50% more mulch and spray 50% more area per tank load. Look at it this way, if you now do 10,000 square feet per load with your conventional wood or paper mulch, you will be able to cover 15,000 square feet per load with HydroStraw® Mulch.

REPLACES BLOWN STRAW

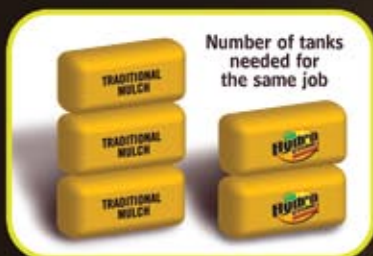

With the increased emphasis on air quality, stormwater control, and other environmental impacts, and the always looming threat of civil action, many public and private landowners are confronted with this dilemma: how to design treatments appropriate for both stormwater control and the maintenance of air quality? In response to this situation, HydroStraw® has successfully been introduced and utilized in many areas as an alternative to traditional 3-Step Straw treatments. Visit our website today for more information on HydroStraw® vs. Blown Straw.

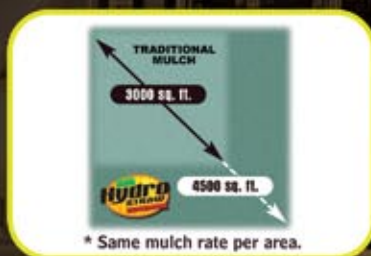

COMMERCIAL BENEFITS

Environmentally safe and responsible product, HydroStraw® is a specially formulated blend of straw, natural fibers and special binding agents. Easy application through a hydro seeder provides a superior mulch matrix as compared to paper, wood or wood/paper mixtures. Green color is appealing and signifies a hydro seeding treatment has been applied. Increased water infiltration onto the job site, equals better germination.

TRADITIONAL MULCH VS. HYDROSTRAW

Number of tanks needed for the same job

* Same mulch rate per area.

Example: With equal tank sizes traditional mulch would cover 3,000 square feet but with HydroStraw® you can cover an additional 50% or 4,500 square feet with the same tank load. Allowing you to achieve 50% more coverage than traditional wood and paper mulches.

We're making neighbors and competitors green with envy.
